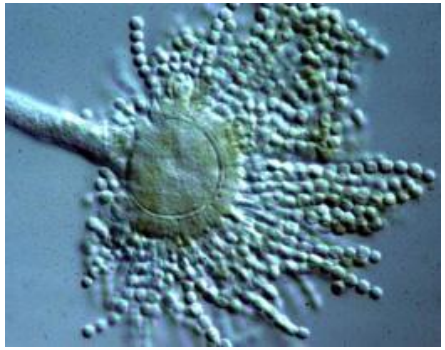
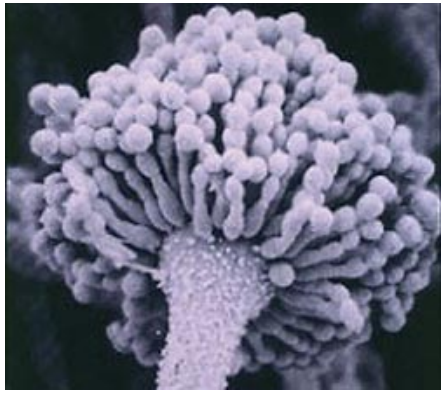
Food Safety and Mycotoxins: MycoRed Structure and Results

Michelangelo Pascale

Institute of Sciences of Food Production (ISPA)
National Research Council of Italy (CNR), Bari, ITALY

WHAT ARE MYCOTOXINS?



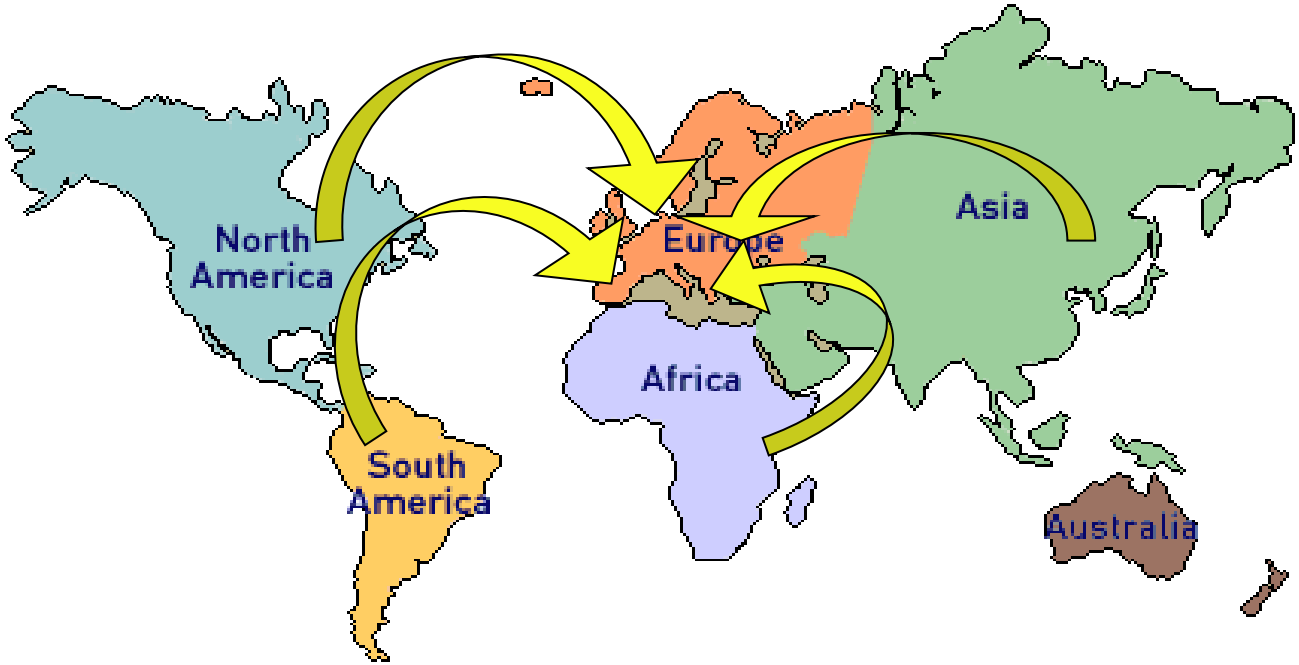


- Toxic secondary metabolites produced by moulds (mainly *Aspergillus*, *Penicillium, Fusarium*).
- Contamination occurs in the field and can increase during harvesting, drying and storage.
- More than 400 different mycotoxins are known about 10% of which occur in foods, being the main source for human exposure.
- Several fungal genera could produce the same mycotoxin / the same genus could produce different mycotoxins.

WHAT ARE MYCOTOXINS?

- Resistance to common thermal treatments.
- Cereals and cereal products, vegetables, dried fruit, spices, wine, beer, coffee, milk, cheeses, meat and eggs may be contaminated by mycotoxins.
- In the world, more than 25 % of foods are considered significantly contaminated by mycotoxins (source FAO).
- Contamination and severity of the problem vary from year to year and also from one geographic region to another.

Mycotoxin problems due to trade exchanges



Imported products with high risk of mycotoxin contamination:

- **maize** (fumonisins and aflatoxins) **from all continents**
- **cereals** (deoxynivalenol, ochratoxin A) **mostly from north and south America**
- **coffee** (ochratoxin A) **mostly South America & Africa**
- **pistachio nuts** (aflatoxins) **mostly from North Africa & Asia**
- **peanuts & other nuts** (aflatoxins) **mostly North, South America & Africa**
- **spices** (aflatoxins) **mostly from Asia & Africa**

The MycoRed project

The project addressed the problem of mycotoxins at global level, aiming to :

- develop novel solution-driven methodologies and handling procedures to reduce both pre- and post-harvest contamination in selected feed and food chains
- generate and disseminate information and education strategies to reduce mycotoxin risks worldwide
- create a wide interest among players and international network

High risk areas of Africa, Asia and Latin America have received major attention by cooperation with international agriculture and food organizations and by applying the results of all technical workpackages

PRE-HARVEST (WP1)

Results FIELD

- Several <u>wheat</u> genotypes with low FHB incidence and DON content have been identified

- <u>In corn,</u> resistance to *F. graminearum*, *F. verticillioides* and *F. culmorum* have been detected in several hybrids

PRE-HARVEST (WP1)

Results FIELD

In **resistant maize** most of the genes provide a basal level of defence to the fungus <u>prior</u> to infection.

In **susceptible maize** most of the PR genes are induced <u>after</u> infection.

Infection with *Fusarium verticilloides*

Induction of about 80 early genes

Induction of about 240 late genes

Results
STORAGE &

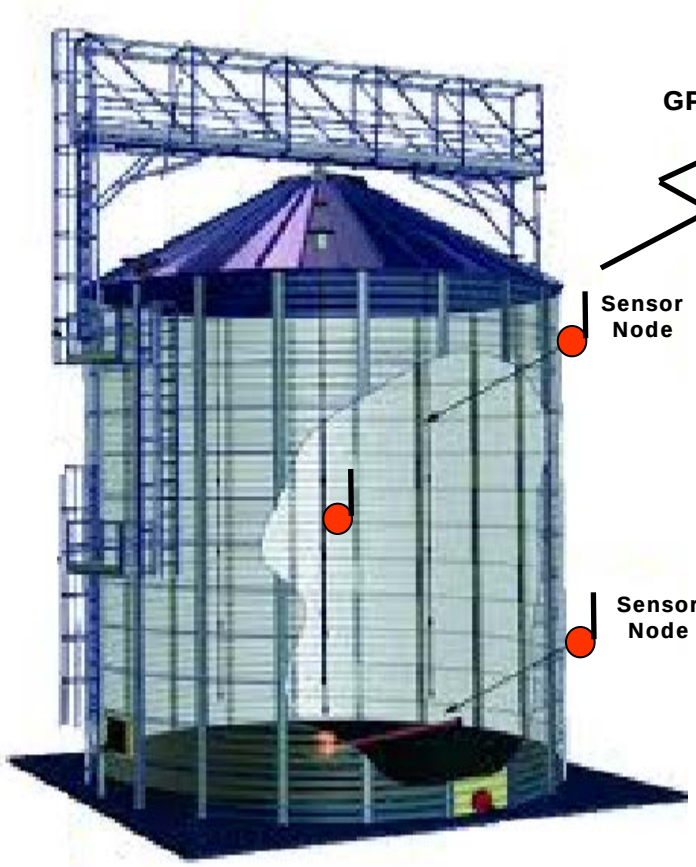
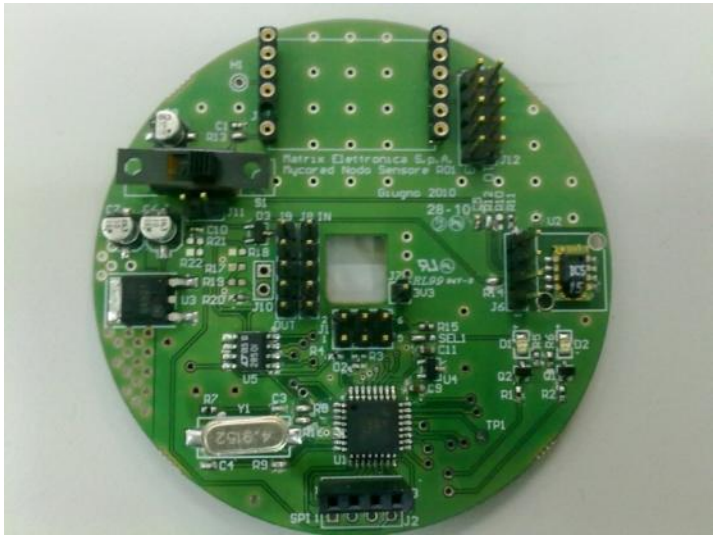
NOVEL POST-HARVEST AND STORAGE HANDLING PRACTICES (WP4)



Ambient intelligence system

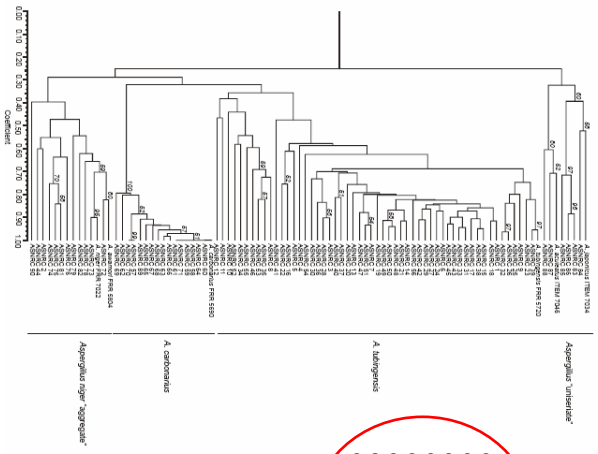


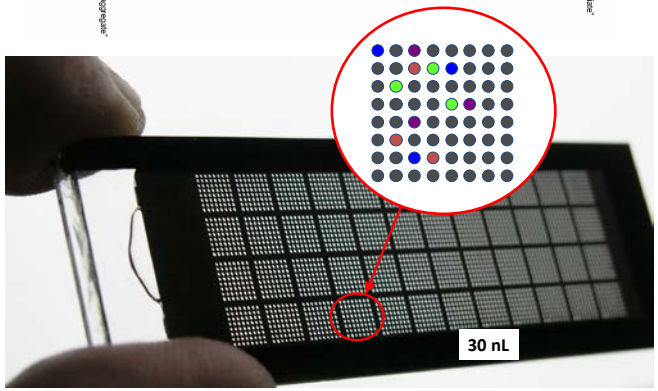
Sensor Node

A wireless sensor network device has been developed and used into pilot scale grain silos to monitor temperature, humidity and CO_2.

Results
RISK
ASSESSMENT

ADVANCED TECHNOLOGIES TO CONTROL TOXIGENIC FUNGI (WP6)





- **A large number of *Fusarium* species (+ 1000) were isolated from wheat kernels worldwide, showing intra and inter genetic variability and different toxigenic profiles.**

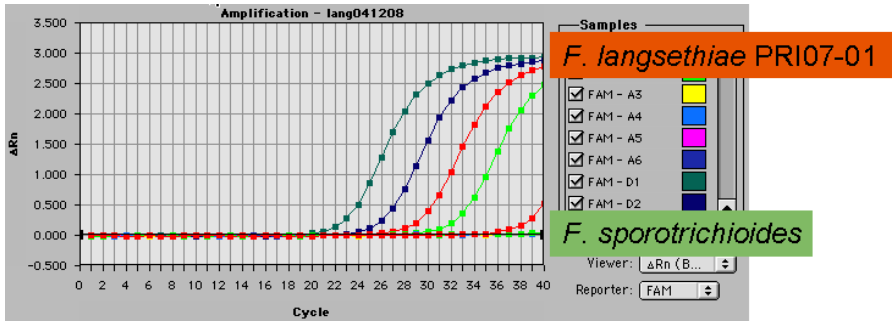
  All strains are deposited in ISPA-ITEM fungal Collection
  http://server.ispa.cnr.it/ITEM/Collection

- **Novel technologies (DNA arrays) to quantify *Aspergillus, Fusarium and Penicillium* from different commodities.**

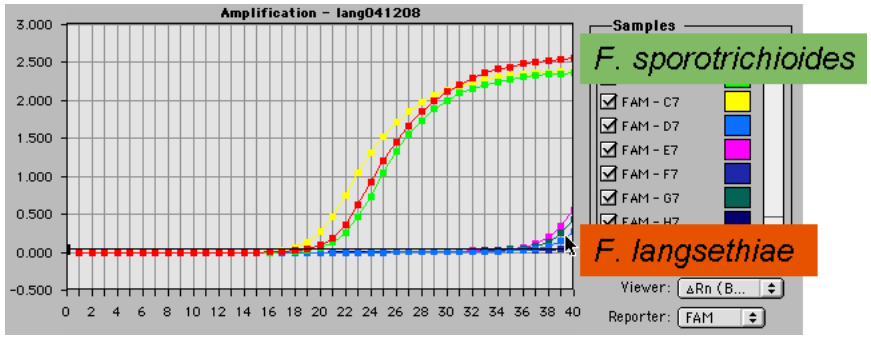
- **Novel approaches to control mycotoxigenic fungi by application of light at different wavelengths permitting a better control of fungal growth and toxin production.**

Results
RISK
ASSESSMENT

ADVANCED TECHNOLOGIES TO CONTROL TOXIGENIC FUNGI (WP6)



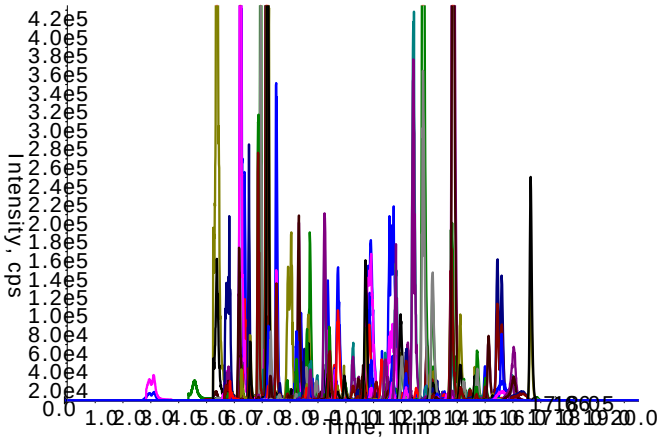
- Specific detection of ***F. langsethiae*** DNA with the *F. langsethiae* primer/probe combination.



- Specific detection of ***F. sporotrichioides*** using the corresponding primers and probe.

Results
RAPID
DETECTION

ADVANCED ANALYTICAL TOOLS FOR RAPID MYCOTOXIN DETECTION (WP7)



- Advanced quantitative analytical methods (LC-MS/MS) have been developed and validated for **rapid multi-mycotoxin** detection (250 metabolites) in all commodities addressed by MycoRed.
- A method for the determination of **masked species** of DON and ZEA has been developed.
- Two methods have been developed for the determination of **mycotoxin biomarkers** in urine.
- Rapid **test kits** (strip tests, FPIA) for the detection of DON, AFs and FUMs have been validated.

Rapid methods

Conventional method

EXTRACTION

↓

CLEAN-UP

↓

DETECTION
(GC, HPLC)

Time of analysis: 2 - 10 h

- Tedious sample preparation
  - Grinding of sample
  - Extraction
  - Clean-up
- Time consuming separation and detection
  - GC-ECD (MS)
  - HPLC-DAD (FD, MS)
- Expensive equipments and operation costs

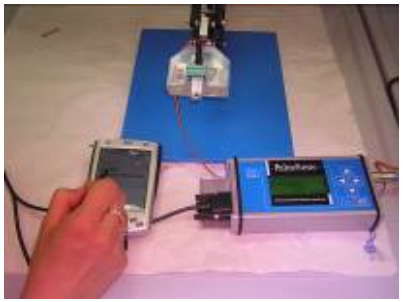
↓

Growing demand for rapid and easy-to-perform methods

Time of analysis: 5 - 20 min

Rapid / Emerging methods for mycotoxin analysis

- **Immunoassays/immunosensors:**
  - Fast-Enzyme Linked Immunosorbent Assay (ELISA)
  - Flow-Through ImmunoAssays (FIA)
  - Lateral Flow Devices (LFD) or dipsticks
  - Fluorescence Polarization ImmunoAssays (FPIA)
  - Electrochemical Immunoassays (SPE)
  - Surface Plasmon Resonance-based sensors (SPR)
  - Multi Analyte Profiling technology (Luminex)
  - Biosensor arrays
- **Infrared spectroscopy** (NIR, MIR, FT-NIR)
- **Electronic nose** (MOS)
- **Methods using alternative receptor** (antibody fragments, peptides, molecularly imprinted polymers, aptamers)

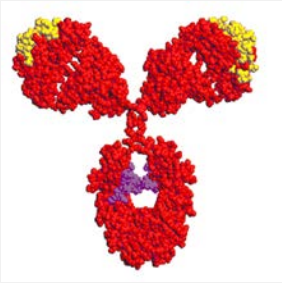


Fluorescence Polarization Immunoassay (FPIA)

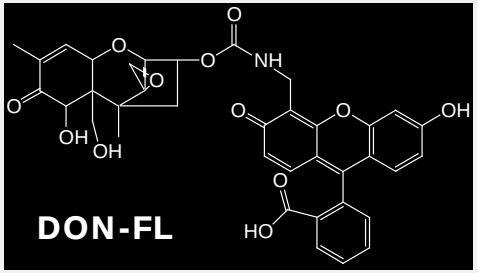
FPIA is a homogeneous competitive fluorescence immunoassay

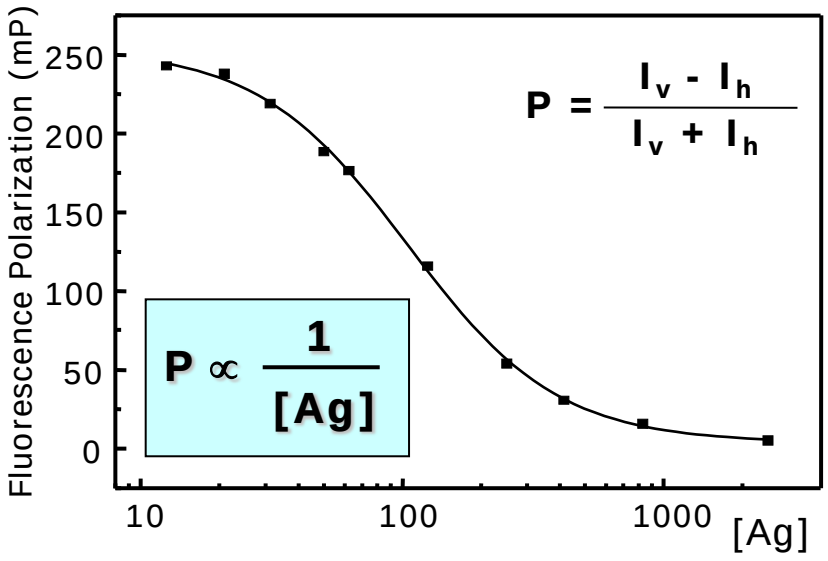
The assay is based on the competition in solution of free antigen (Ag) with a fluorescently tagged antigen (Ag-FL) for an Ag-specific monoclonal antibody.

Elements of an FPIA



- Specific antibody
- Tracer (fluorescent antigen)
- Instrument to measure fluorescence polarization





Assay parameters (i.e. incubation time, precision and sensitivity) depend upon the selection of the appropriate antibody-tracer combination.

FPIA – DON in wheat and derivative products

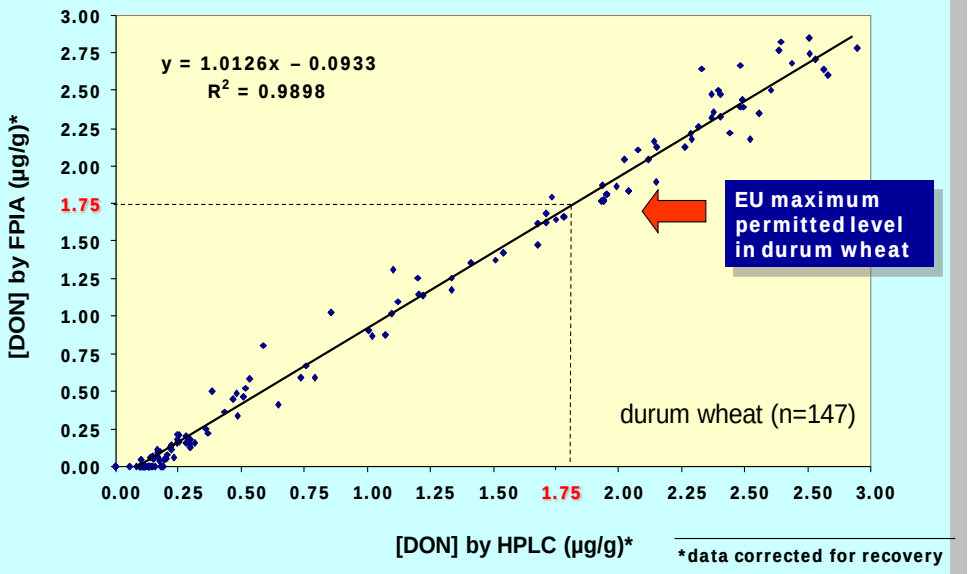
✓ **Applicability:** durum wheat, common wheat, semolina, pasta, bran and whole-wheat flour

✓ **Detection limit:** 0.08 µg/g

✓ **Accuracy:** 98-102%

✓ **Precision:** ≤ 4%

✓ **Time of analysis:** ≤ 10 min



✓ **Linearity range:** 0.1 – 2 µg/g (for concentration >2 µg/g dilution of extract is required)

MULTIPLEX: **6** mycotoxin analysed in **1** test

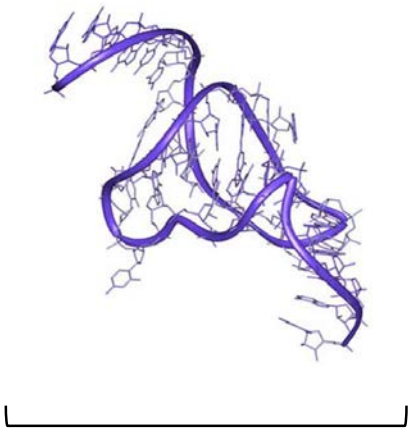
FAST: up to **8 samples** in **1 hour** (including sample preparation)

SENSITIVE: mycotoxin detection at levels close to EU regulatory limits

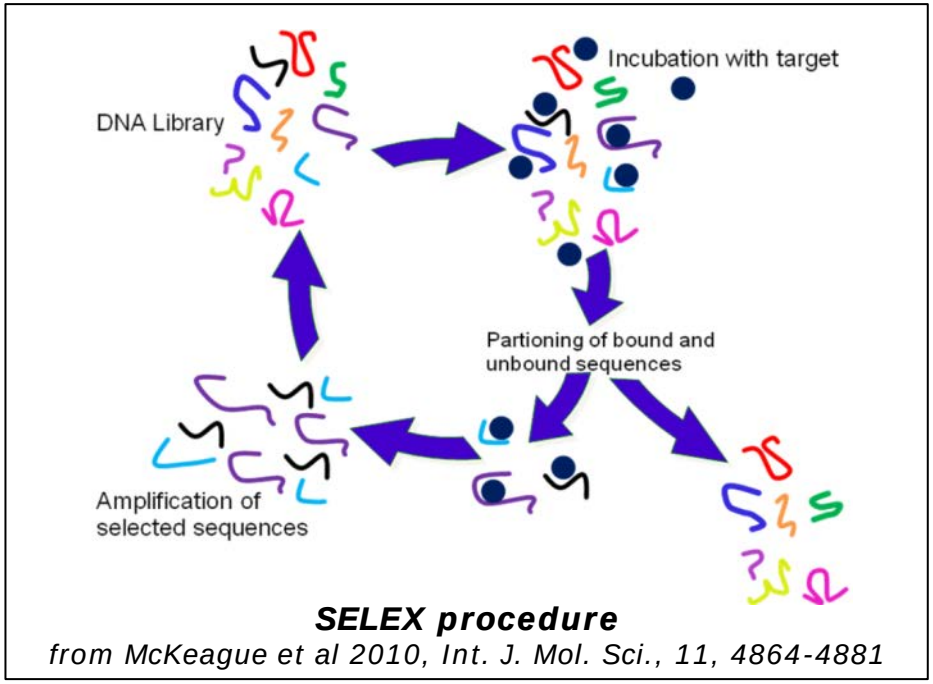
USER FRIENDLY: **5 min** for sample preparation, easily performed on site

Novel materials for mycotoxin analysis: Aptamers

Aptamer



~ 4 nm



SELEX procedure
from McKeague et al 2010, Int. J. Mol. Sci., 11, 4864-4881

- Aptamers are single-stranded oligonucleotides (DNA or RNA) that bind with high affinity and specificity to specific targets.
- Aptamers are produced by an *in vitro* selection process called SELEX (*Systematic Evolution of Ligands by Exponential)*.
- Aptamers, like antibodies, have potential in a broad range of applications including biosensors, affinity chromatography, lateral flow devices.
- Aptamers for OTA, FB_1, AFB_1 and ZEA have been produced.

LOD	0.7 µg/mL	1 µg/mL
LOQ	4 µg/mL	4 µg/mL

WORK IN PROGRESS .....

Mycotoxins

- ✓ Development of an **immunosensor based on electrochemical impedance spectroscopy** (EIS) for the determination of aflatoxin M1 in milk (in collaboration with CNR-NANO)
- ✓ Development of an **immunosensor based on EIS** for the determination of ochratoxin A (OTA) in meat products (in collaboration with CNR-NANO)

Aptamers

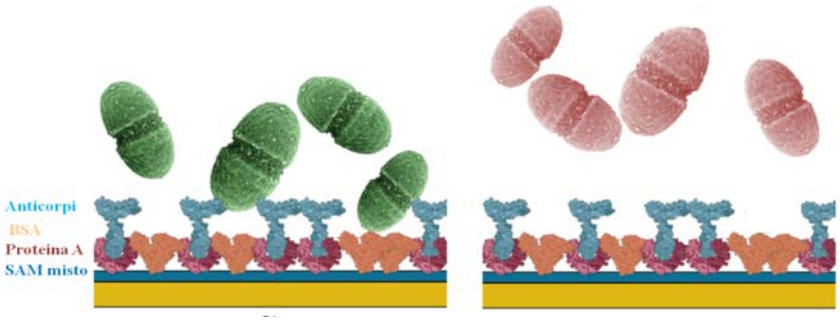
- ✓ Development of a **lateral flow devices** (LFD) for the determination of OTA in meat products.
- ✓ Selection of **aptamers for biogenic amines** (thyramine, histamine).

Allergens

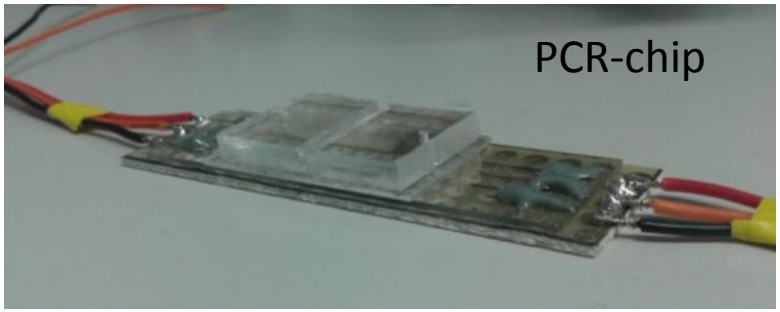
- ✓ Ovalbumin in wine: method transfer to a **miniaturized SPR portable device**.
- ✓ Coupling with **AuNPs to increase sensitivity** of the method.

WORK IN PROGRESS .....

Pathogens and microorganisms



- ✓ Development of an **immunosensor based on electrochemical impedance spectroscopy** (EIS) for the detection of pathogens (*Salmonella* spp., *Listeria monocytogenes)* in meat (in collaboration with CNR-NANO)



- ✓ Development of a **lab-on-a-chip** for the detection of pathogens (*Salmonella* spp., *Listeria monocytogenes, Campylobacte*r spp., *Staphylococcus aureus)* in meat (in collaboration with CNR-NANO)

- ✓ Development of a **lab-on-a-chip** for the detection of moulds and yeasts in dairy products (in collaboration with CNR-NANO)
